Supplementary Table 1: Raw data of islet viability staining by fluorescein diacetate (green) for living cells and propidium iodide (red) for dead cells. The viability rate was expressed by the percentage of green area to the total area within intact islet. The raw data are related to **Figure 4** in the main text.

Percentage of green area to the total area within each islet			
Control	MSC	MSC-Exo	MSC-CM-without-Exo
75	100	100	100

MSC: mesenchymal stem cell; MSC-Exo: MSC-derived exosomes; MSC-CM-without-Exo: MSC-conditioned medium without exosomes

Supplementary Table 2: Raw data of TUNEL-positive (apoptotic) cells. Apoptotic cells were green fluorescent and the nuclei were stained blue by DAPI dye. The percentage of apoptotic islets was expressed by the percentage of TUNEL-positive cells out of all nuclei within each islet. The raw data are related to Figure 5 in the main text.

Percentage of TUNEL-positive cells (green) to total nuclei (blue)												
Control			MSC			MSC-Exo			MSC-CM-without-Exo

VEGF: Vascular endothelial growth factor; MSC: Mesenchymal stem cell; MSC-Exo: MSC-derived exosomes; MSC-CM-without-Exo: MSC-conditioned medium without exosomes

Supplementary Table 7: Raw data of insulin concentration (ng/ml) after 2.8 mM and 20 mM glucose stimulation in mouse islets co-cultured with MSC, MSC-Exo, and MSC-CM-without-Exo. Glucose stimulation index (GSI) was calculated by dividing the value of insulin secretion in 20 mM glucose medium into the value obtained in the 2.8 mM glucose medium. The raw data are related to **Figure 9B** in the main text.

Control		MSC		MSC-Exo		MSC-CM-without-Exo		GSI (20 mM/2.8 mM)			
2.8 mM	20 mM	2.8 mM	20 mM	2.8 mM	20 mM	2.8 mM	20 mM	Control	MSC	MSC-Exo	MSC-CM-without-Exo
