Supplementary Figure 1: Analysis of leukocyte subpopulations by multicolor flow cytometry.

A) Gating strategy for a general overview of lymphocyte and monocyte subpopulations.

B) Quantitative analysis of flow cytometry data for HH patients compared to healthy controls (each n=21): Mean ± SD of % NK cells of lymphocytes, % T cells of lymphocytes, % B cells of lymphocytes, % CD14 positive monocytes of monocytes (in PBMC). The data is analyzed by Wilcoxon rank-sum test, also called Mann-Whitney U test; no statistical significance was detected.
